Well-Appearing Infant 22-60 Days with Bronchiolitis

Infants with known bronchiolitis are low-risk

- The AAP guideline excludes infants with clinical bronchiolitis from their algorithms because they are lower risk
- A review (Ralston et al) of 11 studies of febrile infants with clinical bronchiolitis found no cases of meningitis
- Data and analysis from KPNC febrile infants seen in the ED from 2010-2019 found that of those age 22-60 days who were wellappearing and RSV+: 0/119 had bacteremia without meningitis
 0/119 had meningitis

Recommendation for this infant

UA and culture only
